We focused on decision trees to give a solution about the prediction results in PRO knowledge test, we omit some variables to avoid discrimination. In this example, we show a CART algorithm model to predict if a student can approve an exam or not based on their score in Social studies and English in which the ICFES test were performed.

Node Splitting

$$WI = (0,44 \cdot 3) + (0,32 \cdot 5) / 3 + 5$$
$$WI = 0,365$$

$$LI = 1 - ((1/3)^2 + (2/3)^2) = 1 - (5/9)$$
$$LI = 0,44$$

$$RI = 1 - ((4/5)^2 + (1/5)^2) = 1 - (17/25)$$
$$RI = 0,32$$

As an example, this split is based on the condition "Score in Social studies is ≥ 52 ." For this case, left Gini impurity is 0.44, right Gini impurity is 0.32 and weighted Gini impurity is 0.365. It help us to find the minimum percentage to know the success for each node.

	Time Complexity	Memory Complexity
Training the model	$O(N^2 * M * 2^M)$	$O(N * M * 2^M)$
Testing the Model	$O(N * M)$	$O(1)$

Time and memory complexity of the CART algorithm.
Being M the amount of columns and N the amount of rows

Decision-Tree Model

A binary decision tree to predict Saber Pro scores based on the results of Saber 11. Dark green node represent those with a high probability of success, light green an average probability and medium green a low probability of success.
